

Drop the user directly into a specific package + plan instead of making them pick one in-wizard. Useful when your storefront already presented packages and the user clicked "Buy now". The wizard's package-picker step is skipped automatically because a package is already selected.

The integration pattern

Two valid shapes — pass at init time, or set at runtime.

```
// Option A — at init time (loads the wizard already inside the package)
PrescribeRx.init('prx-intake', {
  embedCode: 'YOUR_EMBED_CODE',
  package:   'PKG-00123',          // human-friendly
});

// Option B — runtime, after the user clicks something on YOUR page
PrescribeRx.selectPackage('PKG-00123');
PrescribeRx.selectPlan('019d4f...uuid'); // optional — pin the subscription

// Option C — multiple packages (rarely needed; bundles)
PrescribeRx.selectPackages(['PKG-001', 'PKG-002']);
```

Try it — pick a package

Enter a real `package_number` from your tenant (list via `GET /api/v1/packages`) and pick a plan. The plan picker is auto-populated from `/api/v1/packages/{id}` after you enter a valid package number — no fake placeholders.

package_number:

plan:

[List available packages](#)[Load plans for entered number](#)[selectPackage / selectPlan](#)[Reset wizard](#)

This demo pulls a sandbox token from `/api/docs/tokens` (non-prod only) so it can hit `/api/v1/packages` from the browser. In production your BACKEND should call `/api/v1/packages` and your frontend just renders the result — never expose tenant tokens to the browser.

Live wizard

SANDBOX MODE — TEST TRANSACTION ONLY. No real charges will be processed. Use test card **4111 1111 1111 1111**, any future expiration, any 3-digit CVC.
