

You charged the patient on YOUR gateway (Braintree, Adyen, Worldpay — whatever you already integrated). PRX never calls back to that gateway; we just record the transaction for audit, receipts, refund reconciliation, and the encounter's payment status. `setTransaction` is a one-call shortcut for this — equivalent to `setPayment({ mode: 'reference_captured', ...})`.

The integration pattern

```
// 1. Charge the patient on YOUR gateway (typical Stripe / Braintree / etc.)
const result = await stripe.paymentIntents.create({
  amount: 29900,           // in cents
  currency: 'usd',
  payment_method: paymentMethodId,
  confirm: true
});

// 2. Record the transaction in PRX so it shows up on the order + statement
PrescribeRx.setTransaction({
  transaction_id: result.id,           // 'pi_3PqK...'
  amount:        result.amount / 100, // $299.00
  gateway:       'stripe',             // free-form (record-only)
  captured_at:   new Date().toISOString()
});

// That's it. The wizard's payment step shows "Paid" and the encounter's
// resulting Order has a captured Transaction row. PRX never calls Stripe.

// Equivalent — long form via setPayment
PrescribeRx.setPayment({
  mode:       'reference_captured',
  gateway:    'stripe',
  transaction: {
    transaction_id: result.id,
    amount:        result.amount / 100,
    captured_at:   new Date().toISOString()
  }
});
```

[Simulate it — run a fake charge](#)

In production, this is where you'd call `stripe.paymentIntents.create()` or your gateway equivalent. We simulate that round-trip with a 600ms delay, then call `setTransaction`.

Amount: USD

Gateway: 

Charge + setTransaction

Reset wizard

Notice: `gateway` accepts ANY string in `reference_captured` mode. PRX records it for your audit cross-reference but never calls back. If you mis-spell it, no harm.

Live wizard

SANDBOX MODE — TEST TRANSACTION ONLY. No real charges will be processed. Use test card **4111 1111 1111 1111**, any future expiration, any 3-digit CVC.

```

Verifying the recorded transaction

After the encounter is created, fetch the resulting order and check its transactions. The `external_transaction_id` column holds the ID you passed in.

```
curl ".../api/v1/orders/{ORDER_ID}/transactions" \  
  -H "Authorization: Bearer $TOKEN"
```
